Application Installations

Reliable installs for critical software.

Application installations for critical discovery, investigation and governance platform software is NOT a breeze, as we have learned over 15 years of conducting real-world installs. Every platform is different, with varying complexities, integrations, and customizations, and unfortunately, there is no simple “run program” button that delivers immediate and effortless success. The complexity of installing the application is only the first hurdle, as every application installation must be configured and tuned according to your specific workflow needs and requirements.

Our team of time-tested Application Engineers excel in delivering flawless application installations for your mission-critical platforms. They understand and adhere to client go-live requirements to accurately configure, integrate and test application(s) as part of the broader workflow. In the week following an installation, your team will have 24/7 access to our global pool of engineers should questions or issues arise.

Our symbiotic, long-term relationships with leading eDiscovery application developers allow us to understand every nuance, variable, and change that can affect platform performance. We have successfully installed and integrated industry-specific applications for the past 15 years.

The Benefits of GJ Application Installations:

- Painless, comprehensive installation and integration of your application(s) to support critical business operations
- Turnkey engagement and quality management driven by a dedicated, experienced business consultant
- Accelerated time-to-market for application installation
- Peace of mind in knowing that your application installation has been configured according to 15 years of George Jon best practices
- Ability to engage George Jon for future upgrades, hot fixes, and managed services without incurring any onboarding or assessment fees
- A bespoke report with full documentation surrounding your application specifications and key considerations for future scaling
